| | Insolubles % | 20.0 | <0.6 | | |
| | TBN | 24.0 | >1.0 | | |

The very high levels of potassium and sodium are a dead giveaway here; this Jeep has a major antifreeze problem. That's a common weakness of these 4.0L engines -- antifreeze tends to strike around 100,000 miles, but once the problem is fixed it can be quite a while before the issue reappears. That's what you're seeing here. The head gasket is allowing coolant into the oil supply, which does several bad things. Coolant destroys the oil's ability to lubricate, causing poor wear throughout the engine but especially at the bearings (copper, lead, tin) and shafts (iron). It also thickens the viscosity and causes sludge (insolubles) to form so the oil doesn't circulate as freely. Note the very high TBN -- excessive antifreeze contamination throws off a TBN reading. This engine needs help, pronto!
